

Subject card

Subject name and code	Modelling on Financial Market, PG_00178120						
Field of study	Informatics and Econometrics						
Date of commencement of studies	October 2025		Academic year of realisation of subject		2027/2028		
Education level	Bachelor's studies		Subject group		Optional subject group Subject group related to scientific research in the field of study		
Mode of study	full-time studies		Mode of delivery		at the university		
Year of study	3		Language of instruction		Polish		
Semester of study	6		ECTS credits		7.0		
Learning profile	academic		Assessment form		exam		
Conducting unit	Department of Econometrics -> Faculty of Management -> Rector						
Name and surname of lecturer (lecturers)	Subject supervisor		dr Sabina Nowak				
	Teachers						
Lesson types	Lesson type	Lecture	Tutorial	Laboratory	Project	Seminar	SUM
	Number of study hours	30.0	30.0	15.0	0.0	0.0	75
	E-learning hours included: 0.0						
Learning activity and number of study hours	Learning activity	Participation in didactic classes included in study plan		Participation in consultation hours		Self-study	SUM
	Number of study hours	75		4.0		96.0	175
Subject objectives	1. Understanding the fundamental financial properties of time series, as well as modeling and forecasting methods. 2. Exploring the various types of factor models used to describe time series of returns in the capital market, and developing the ability to apply these models in financial analysis. 3. Grasping the concept of an efficient market as explained by Fama, and being able to present rational arguments both for and against the efficiency of the capital market. 4. Learning the basic principles governing the operation of financial markets, particularly in relation to their microstructure.						

Learning outcomes	Course outcome	Subject outcome	Method of verification
	[liEL3_U04] Students can build and interpret models of economic and social phenomena and processes for decision-making processes.	The student is able to specify models based on transaction indicators for making investment decisions.	[SU2] presentation/project/paper/report
	[liEL3_W02] To an advanced degree, the student knows and understands selected theoretical and practical issues in informatics, statistics or econometrics necessary for understanding economic and social phenomena.	The student understands and correctly applies models for time series of financial market return rates.	[SW4] test/exam - oral or written [SW2] presentation/project/paper/report
	[liEL3_U03] Students can obtain data from appropriately selected sources, use these data to solve economic and social problems, and process and interpret them using econometrics, informatics or statistics tools.	The student is able to collect financial data from various databases, both cross-sectional and time-series, verify its accuracy, and utilize it to construct models that describe the financial market.	[SU2] presentation/project/paper/report
	[liEL3_U07] The student can prepare written papers, presentations, and oral speeches on problems in econometrics, informatics, or statistics.	The student is able to work in a team to develop an issue related to the market efficiency hypothesis or the financial market microstructure and present the model to the group.	[SU2] presentation/project/paper/report
	[liEL3_U02] Students can select or construct econometrics, informatics or statistics tools and apply them to describe and solve economic and social problems.	The student is able to select an appropriate factor model to describe the rates of return on financial instruments.	[SU2] presentation/project/paper/report
Subject contents	[liEL3_W05] To an advanced degree, the student knows and understands the methods, techniques and informatics or statistics tools used to acquire, collect, process and present data in decision-making processes.	The student identifies different types of data related to financial market phenomena and can visualize them.	[SW2] presentation/project/paper/report
	1. Characteristics and features of financial time series. 2. Basic concepts related to financial time series. Stationarity. White noise. Correlogram. Autocorrelation function. Unit root tests. 3. Modelling financial time series. ARMA, ARIMA, and SARIMA models. 4. Forecasting stock returns based on financial time series models. Measures of forecast quality. 5. Estimation and verification of asset pricing models: Sharpe, CAPM, and APT models; Fama and French's multifactor asset pricing models; stochastic discount factor model as a generalization. 6. The efficient market hypothesis and its forms. Testing for weak efficiency - series tests, examination of calendar effects. Testing for semi-strong efficiency - momentum and contrarian strategies, event study analysis. Testing for strong efficiency - examination of investment fund performance. 7. Financial market microstructure: definition, various forms of market organization, and their characteristics. High-frequency data. Examples from global markets. 8. Intraday trading patterns in stock returns, bid-ask spreads, and volumes. 9. Trade classification rules and their accuracy. 10. Bid-ask spread models based on transaction indicators. Factors explaining the bid-ask spread.		
	Prerequisites and co-requisites: Students need a basic understanding of mathematical statistics for formulating and testing statistical hypotheses, knowledge of econometrics for standard single-equation and multi-equation models, and an understanding of the capital market for investing under risk conditions.		
	Assessment methods and criteria	Subject passing criteria	Passing threshold
		Credit for labs: project with presentation	51.0%
		Written exam	50.0%
Recommended reading	Basic literature	Percentage of the final grade	
		Credit for tutorials: test	25.0%
