

Subject card

Subject name and code	Generalized Linear Models, PG_00178720						
Field of study	Informatics and Econometrics						
Date of commencement of studies	October 2025		Academic year of realisation of subject			2025/2026	
Education level	Master's studies		Subject group			Obligatory subject group in the field of study Optional subject group Subject group related to scientific research in the field of study	
Mode of study	part-time studies		Mode of delivery			at the university	
Year of study	1		Language of instruction			Polish	
Semester of study	2		ECTS credits			5.0	
Learning profile	academic		Assessment form			credit	
Conducting unit	Department of Statistics -> Faculty of Management -> Rector						
Name and surname of lecturer (lecturers)	Subject supervisor		dr hab. Beata Jackowska				
	Teachers						
Lesson types	Lesson type	Lecture	Tutorial	Laboratory	Project	Seminar	SUM
	Number of study hours	8.0	0.0	24.0	0.0	0.0	32
	E-learning hours included: 0.0						
Learning activity and number of study hours	Learning activity	Participation in didactic classes included in study plan		Participation in consultation hours		Self-study	SUM
	Number of study hours	32		2.0		91.0	125
Subject objectives	Gaining knowledge about the construction and verification of generalized linear models, in particular logistic models. Acquiring skills in estimating and verifying models based on empirical data and interpreting the obtained results. Learning about the possibilities of the applications these models to build credit scoring. Learning about the stages of building scoring models.						

Learning outcomes	Course outcome	Subject outcome	Method of verification
	[liEMU2_U03] The student is able to obtain and verify data from properly selected sources and to collect, process, and visualize it using modern econometrics, informatics or statistics tools.	The student is able to use generalized linear models to identify cause-and-effect relationships and search for regularities occurring in the analyzed data set. On the basis of empirical data, the student is able to estimate and verify the models and interpret the obtained results.	[SU2] presentation/project/paper/report
	[liEMU2_W02] The student comprehends advanced theoretical and practical concepts in econometrics, informatics, or statistics, which are essential for a deeper understanding of economic and social phenomena.	The student explains the essence of generalized linear models and scoring models, describes the stages of their development, and identifies possible applications of these models, including their use in building scoring models.	[SW4] test/exam - oral or written [SW2] presentation/project/paper/report [SW3] text preparation/written work
	[liEMU2_W05] The student possesses advanced knowledge and understanding of informatics, statistics, and econometrics techniques and tools used to acquire, process, or visualise data to aid in decision-making and verify research hypotheses.	The student knows and understands the methods of estimation and verification of generalized linear models and scoring models.	[SW4] test/exam - oral or written [SW2] presentation/project/paper/report [SW3] text preparation/written work
	[liEMU2_U01] The student can creatively and profoundly analyze complex social and economic processes using structured knowledge, econometrics, informatics, or statistics tools.	The student is able to identify a research problem, formulate research hypotheses, select and apply appropriate modeling methods to solve the researched problem.	[SU2] presentation/project/paper/report
Subject contents	Generalized linear models 1. Model form: random component, systematic component, a link function connecting random and systematic components. Distribution of the response variable and link function. Canonical link functions for selected distributions. 2. Essence and application possibilities of generalized linear models for response variables: continuous, dichotomous (binary), count, ordinal. 3. Method of estimation model parameters. 4. Stages of model construction (preparation of variables, choice of model form, estimation of model parameters, model verification). 5. Logistic model as a generalized linear model for a qualitative response variable (dichotomous or with more than two categories). 6. Statistical inference in logistic regression. Evaluation of the logistic model: assessment of model fit (pseudo-R² measures), information criteria, assessment of classification performance (measures based on the confusion matrix and measures based on the ROC curve). Taking into account the interactions between explanatory variables. 7. The concept of odds and odds ratio. Interpretation of the resulting model. 8. Use of the binary logistic model to assess the risk of an event depending on the characteristics of the object (e.g. to assess credit risk, insurance risk, unemployment risk). Use of the binary and multinomial logistic model in survey studies to questions with two or more answer variants (e.g. survey of preferences, opinions, satisfaction). Scoring models 1. Introduction to scoring 2. Data preparation data quality assessment, predictor selection, variable discretization, measure of predictive ability for variables and their attributes 3. Development of a logistic regression model using quasi-continuous variables 4. Scorecard development 5. Scoring-model evaluation 6. Comparison of scoring models 7. Optimal segmentation of a set of individuals into homogeneous risk groups (cut-off point management) 8. Comparison of two datasets (population stability analysis) 9. Incorporation of rejected-application data (analysis of rejected applications) 10. Scoring-model monitoring		
Prerequisites and co-requisites	Knowledge of the subject program "Quantitative and qualitative research techniques" (1st semester of studies): 1. basics of correlation analysis and regression analysis 2. basics of point and interval estimation and hypothesis testing		

Assessment methods and criteria	Subject passing criteria	Passing threshold	Percentage of the final grade
	Final project – realization of a final project in teams in the form of a written study of data analysis results using the scoring model	51.0%	33.0%
	Final project – realization of a final project in teams in the form of a written study of data analysis results using the logistic model	51.0%	33.0%
	Written colloquium with open questions and tasks	51.0%	34.0%
