| Subject objectives                          | <p>We will study mathematical knots that model knots that we encounter in our environment. We will see how knots can be formally written using diagrams, and in turn, knot diagrams can be encoded in various ways. One of the basic concepts will be the so-called Reidemeister moves, which allow us to move between different diagrams of the same knot. With the help of these moves, we will define various knot invariants, i.e. functions that assign to each knot an element of some algebraic object, e.g. a set of integers or polynomials. Such functions are often defined on knot diagrams, but we require that they have the same value on different diagrams of the same knot. Important examples of such invariants that we will consider are: the Jones polynomial, the Conway-Alexander polynomial, and the Fox n-coloring.</p> <p>Another topic will be the fundamental group of a knot. To introduce this concept, we will need to learn some elements of group theory and algebraic topology.</p> |                                                          |                                         |                                     |         |                   |     |

| Prerequisites and co-requisites                                | Elementary knowledge of analysis, linear algebra. It is good if the student knows the basics of abstract algebra, although this will also be developed during the seminar.                                                                                                                                                                                                                                                                                                                     |                                                                                                                                                                                                                                                                                                                                                                           |                               |
