

Subject card

Subject name and code	Innovative spatial management: a glimpse into the future, PG_00191818						
Field of study	Spatial Management						
Date of commencement of studies	October 2027		Academic year of realisation of subject		2027/2028		
Education level	Master's studies		Subject group		Obligatory subject group in the field of study Subject group related to scientific research in the field of study		
Mode of study	full-time studies		Mode of delivery		at the university		
Year of study	1		Language of instruction		Polish		
Semester of study	2		ECTS credits		1.0		
Learning profile	academic		Assessment form		credit		
Conducting unit							
Name and surname of lecturer (lecturers)	Subject supervisor		dr Hanna Obracht-Prondzyńska				
	Teachers						
Lesson types	Lesson type	Lecture	Tutorial	Laboratory	Project	Seminar	SUM
	Number of study hours	20.0	0.0	0.0	0.0	0.0	20
	E-learning hours included: 0.0						
Learning activity and number of study hours	Learning activity	Participation in didactic classes included in study plan		Participation in consultation hours		Self-study	SUM
	Number of study hours	20		0.0		5.0	25
Subject objectives	The aim of the course is to prepare students to operate in the rapidly evolving field of spatial planning and management by introducing them to future-oriented trends, technologies, and tools used in planning, managing, and analysing space. The course focuses on the role of artificial intelligence, big data analytics, digital city models, and digital tools that support more sustainable, resilient, and inclusive territorial development. An important component of the course is the development of practical competencies related to data analysis, experimentation with emerging technologies, and designing innovative solutions to address future spatial challenges.						

Learning outcomes	Course outcome	Subject outcome	Method of verification
	[GPMU2_W07] knows basic principles for creating and developing forms of individual entrepreneurship that make use of knowledge in the field of spatial management and corporate social responsibility, with particular emphasis on responsibility for environmental impact	The student understands contemporary models for developing innovative services, products, and technological solutions used in spatial planning and management, and recognizes the importance of the responsible implementation of new technologies with consideration for social, environmental, and ethical aspects.	[SW2] presentation/project/paper/report [SW5] implementation of a problem task
	[GPMU2_W06] identifies problems and theories in spatial management, taking into account complex dependencies and trends of changes in the natural environment; understands their theoretical and practical significance	The student understands contemporary models for developing innovative services, products, and technological solutions applied in spatial planning and management, and recognizes the importance of responsible implementation of new technologies with regard to social, environmental, and ethical considerations.	[SW2] presentation/project/paper/report [SW5] implementation of a problem task
	[GPMU2_U06] can organise and lead a debate among diverse audiences regarding spatial conflicts, with particular emphasis on environmental conflicts	The student is able to communicate the results of data-driven spatial analyses and present proposals for innovative technological solutions addressing contemporary spatial conflicts and challenges to diverse stakeholder groups.	[SU2] presentation/project/paper/report [SU5] implementation of a problem task
	[GPMU2_K02] is ready to solve cognitive and practical problems in the field of economic and social geography based on acquired knowledge in cooperation with various entities, including representatives of local government units	The student is prepared to collaboratively use digital tools, artificial intelligence, and big data analytics to address practical challenges in spatial planning and management in cooperation with representatives of the public, private, and social sectors.	[SK2] presentation/project/paper/report [SK6] demonstration of practical skills
Subject contents	- Digital transformation of spatial planning and management emerging trends and future directions of the sector - Digital twins for cities and their applications in spatial planning, infrastructure management, and development scenario modelling - Artificial intelligence in spatial analysis and decision-making processes - Big data in spatial planning and management data sources, analytical opportunities, and ethical limitations - Digital tools supporting urban climate adaptation, mobility development, investment processes, and inclusive space design - Digital participation tools and applications engaging residents in urban processes - Immersive technologies and spatial prototyping (e.g. VR/AR, 3D printing, drones, spatial modelling) - The role of digital competencies and basic programming skills in the future of spatial planning professions - Case studies of innovative implementations developed by cities, technology companies, and the public sector - Practical application of selected digital tools in analysing real-world spatial challenges		
Prerequisites and co-requisites			
Assessment methods and criteria	Subject passing criteria	Passing threshold	Percentage of the final grade
	Analysis of a selected big dataset presented in the form of a presentation	51.0%	100.0%

	eResources addresses	
Example issues/ example questions/ tasks being completed	Example topics / questions / assignments • How are digital twins transforming urban planning, infrastructure management, and public decision-making? • Can artificial intelligence improve spatial planning processes? Opportunities and limitations of AI in urban governance. • How can big data support evidence-based planning and policy-making? • What are the ethical risks associated with algorithmic decision-making in cities? • How can digital tools support climate adaptation and resilience planning? • In what ways can technology improve urban mobility systems and transport planning? • How do digital platforms reshape housing markets, tourism, and urban economies? • Can digital participation tools strengthen citizen engagement in planning processes? • What skills will future spatial planning professionals need in the era of AI and automation? • How are cities using drones, VR/AR, and 3D printing in urban planning practice? Example practical assignments • Testing selected digital tools used in spatial planning and urban management • Analysing selected large datasets related to urban development challenges • Identifying spatial patterns based on mobility, housing, safety, or environmental datasets • Preparing recommendations based on data-driven analysis • Presenting team-based solutions to real-world spatial challenges
